# HORIZONTAL SCREENS

## IDEAL FOR THE SELECTION OF AGGREGATES

- minimum dimensions and maximum ease of use
- easy maintenance thanks to the presence of vibrators
- possibility to change the transport speed by adjusting the balance of the vibrators
- high durability compared to wear and stress caused by the electric vibrators

## HORIZONTAL SCREENS – VP SERIES

The vibrating horizontal screens of the VP series are characterized by a unidirectional vibration system obtained by using vibrators with adjustable eccentric masses. The elastic suspension is on steel springs specially sized to dampen the vibration by over 80%. The deck frames are particularly robust and are mounted on the side panels with self-locking bolts. To allow the optional assembly of different types of nets (steel nets, perforated sheets, rubber nets, polyurethane panels, etc.), the central supporting spars are fixed to the crossbars of the frames by means of self-locking bolts. The deck supporting walls of the screen are always equipped with holes for the bolts of the lateral tension anchors. The central longitudinal supports are equipped with wear-resistant rubber seals.

only components of the best brands
